Frontend Shop

Please provide a demo application, featuring a web shop:

- no login/registering required
- user can see a list of available products
- user can select a product from the list and see a "product details" page with a bigger picture and description
- from the "product details" page user can go back to the list of products
- user can choose a product in the list or in the "product details" page and click its button "buy now"
- "buy now" leads to a "purchase confirmation" page
- user can read some terms of service, accept or decline the purchase
- accepting the purchase leads to "purchase success" page
- declining the purchase leads to the product list

Please use any technologies of your choice. No backend needed, the app can pretend it takes the data from a backend, having that hard-coded in a separate module.
Explain the solution in a *readme* file and describe a way to start and watch it on my local machine.
Suggest any further improvements of the solution
